

PROJECT CONCEPT NOTE

CARBON OFFSET UNIT (CoU) PROJECT

Title: Enercon Wind Farm (Hindustan) Ltd in Karnataka

Version 1.0
Date 14/02/2022
First CoU Issuance Period: 3 years, 4 months
Date: 27/10/2018 to 31/01/2022

Project Concept Note (PCN) CARBON OFFSET UNIT (CoU) PROJECT

BASIC INFORMATION				
Title of the project activity	Enercon Wind Farm (Hindustan) Ltd in Karnataka			
Scale of the project activity	Large Scale			
Completion date of the PCN	14/02/2022			
Project participants	M/s Wind World (India) Limited			
Host Party	India			
Applied methodologies and standardized baselines	Consolidated methodology for grid-connected electricity generation from renewable sources, ACM0002, Version 6 Standardized baselines: Not applicable			
Sectoral scopes	SELECT SCOPE Sectoral Scope 1, Energy industries (renewable/non-renewable sources).			
Estimated amount of total GHG emission reductions	119,332 CoUs (119,332 tCO2eq) annually			

SECTION A. Description of project activity

A.1. Purpose and general description of Carbon offset Unit (CoU) project activity >>

The project Enercon Wind Farm (Hindustan) Ltd in Karnataka is located in Chikkanayakanahalli, Gubbi and Hosadurga Village, District Tumkur & Chitradurga, State Karnataka, Country India.

The details of the registered project are as follows:

S.No.	District	Taluka	Village	No. of WEG's
		Chikkanayakanahalli	Dasudi	20
	Tumkur	Chikkanayakanahalli	Nelenuru	5
1	Tullikur	Chikkanayakanahalli	Ganadu	6
		Gubbi	Annenhalli	6
		Gubbi	Siddapura	9
		Hosadurga	Chikkabyaledakere	16
2	Chitmodymaa	Hosadurga	Kanubehalli	11
2	Chitradurga	Hosadurga	Arasinagundi	8
		Hosadurga	Elladakere	5
			Total	86

Purpose of the project activity:

The purpose of the project activity is to utilize renewable wind energy for generation of electricity. The project activity replaces anthropogenic emissions of greenhouse gases (GHG's) into the atmosphere, which is estimated to be approximately 119,332 CoUs (119,332 tCO2eq) annually, by displacing the equivalent amount of electricity generation through the operation of existing fuel mix in the grid comprising mainly fossil fuel-based power plants and future capacity expansions connected to the grid. In the absence of the project activity the equivalent amount of electricity would have been generated from the connected/ new power plants in the Southern regional grid, which are/ will be predominantly based on fossil fuels. Whereas the electricity generation from operation of Wind Energy Convertors (WEC's) is emission free.

A.2 Do no harm or Impact test of the project activity>>

There are social, environmental, economic and technological benefits which contribute to sustainable development.

Social benefits:

- The project activity will lead to the development of supporting infrastructure such as road network etc., in the wind park location, the access to which is also provided to the local population.
- The project activity will lead to alleviation of poverty by establishing direct and indirect benefits through employment generation and improved economic activities by strengthening of local grid of the state electricity utility.
- Use of a renewable source of energy reduces the dependence on imported fossil fuels and associated price variation thereby leading to increased energy security.

• Environmental benefits:

- The project activity employs renewable energy source for electricity generation instead of fossil fuel-based electricity generation which would have emitted gaseous, liquid and/or solid effluents/wastes.
- Being a renewable resource, using wind energy to generate electricity contributes to resource conservation. Thus, the project causes no negative impact on the surrounding environment and contributes to environmental well-being.

• Economic benefits:

- The project activity requires temporary and permanent, skilled and semi-skilled manpower at the wind park; this will create additional employment opportunities in the region.
- The generated electricity will be fed into the NEWNE regional grid through local grid, thereby improving the grid frequency and availability of electricity to the local consumers (villagers & sub-urban habitants) which will provide new opportunities for industries and economic activities to be setup in the area thereby resulting in greater local employment, ultimately leading to overall development.

• Technical benefits:

• Increased interest in wind energy projects will further push R&D efforts by technology providers to develop more efficient and better machinery in future.

A.3. Location of project activity >>

Country: India

District: Tumkur & Chitradurga

Village: Dasudi, Nelenuru, Ganadu, Annenhalli, Siddapura, Chikkabyaledakere, Kanubehalli,

Arasinagundi and Elladakere

Tehsil: Chikkanayakanahalli, Gubbi and Hosadurga

State: Karnataka Code: 577501

Individual WEG location numbers and coordinates are detailed out in below Table 1: -

~	WEG	_]	Latitude (N	N)	L	ongitude	(E)
S.No	Unique Identificatio n Number	Locati on No.	Degree	Minutes	Seconds	Degree	Minute s	Seconds

A.4. Technologies/measures >>

The project activity consists of 86 WEGs of Enercon make E-48 and each machine capacity is of 800 kW (E-48) totalling to the capacity of 68.8 MW. The WEGs generates 3-phase power at 400V, which is stepped up to 33 kV and connected to 33kV metering points. From 33 kV metering points electricity transmitted to WWIL Sub-station. At sub-station electricity is step-up to 220 kV. From WWIL substation electricity is further evacuated to the state electricity grid at 220kV. The Project can operate in the frequency range of 47.5-51.5 Hz and in the voltage range of $400 \text{ V} \pm 12.5\%$.

The other salient features of the state-of-art-technology are:-

- Gearless Construction Rotor & Generator Mounted on same shaft eliminating the Gearbox.
- Variable speed function has the speed range of 18 to 33 RPM thereby ensuring optimum efficiency at all times.
- Variable Pitch functions ensuring maximum energy capture.
- Near Unity Power Factor at all times.
- Minimum drawal (less than 1% of kWh generated) of Reactive Power from the grid.
- No voltage peaks at any time.
- Operating range of the WEG with voltage fluctuation of -20 to +20%.
- Less Wear & Tear since the system eliminates mechanical brake, which are not needed due to low speed generator which runs at maximum speed of 33 rpm and uses Air Brakes.
- Three Independent Braking System.
- Generator achieving rated output at only 33 rpm.
- Incorporates lightning protection system, which includes blades.
- Starts generation of power at wind speed of 3 m/s

WWIL has secured and facilitated the technology transfer for wind based renewable energy generation from Enercon GmbH, has established a manufacturing plant at Daman in India, where along with other components the "Synchronous Generators" using "Vacuum Impregnation" technology are manufactured. Diagram of main component of Enercon make E-48 is shown in below picture:-

Figure: Enercon make E-48 Diagram.

Specification	Value
Turbine model	Enercon E – 53
Rated Power	800 kW
Rated diameter	53 m
Hub height	75 m
Turbine type	Gearless horizontal axis wind turbine with variable rotor speed
Power regulation	Independent electromechanical pitch system for each blade
Cut in wind speed	2.5 m/s
Rated wind speed	12 m/s
Cut out wind speed	28 - 34 m/s
Extreme wind speed	59.5 m/s
Rated rotational speed	32 rpm
Operating range rot. Speed	12 - 29 rpm
Orientation	Upwind
No. of blades	3
Blade material	Fibre glass Epoxy reinforced with integral lightning protection
Gear box type	Gearless
Generator type	Synchronous generator
Braking	Aerodynamic
Output voltage	400 V
Yaw system	Active yawing with 4 electric yaw drives with brake motor and friction bearing
Tower	74 m Concrete

A.5. Parties and project participants >>

Party (Host)	Participants
Government of India (Host)	M/s Wind World (India) Limited

A.6. Baseline Emissions>>

Project activity installs the wind farm at a barren land. Project activity is the installations of green field energy production with the installation of 86 WEGs of WWIL make E-48 of 800 KW each totalling 68.8MW project capacity.

In the absence of the project activity the equivalent amount of electricity would have been generated from the connected/ new power plants in the NEWNE grid, which are/ will be predominantly based on fossil fuels¹, hence baseline scenario of the project activity is the grid-based electricity system, which is also the pre-project scenario. Since the project activity involves power generation from wind, it does not emit any emissions in the atmosphere.

Project activity will harness wind as a source of energy production which is environmentally safe and sound technology. There is no GHG emission through project activity. The WEGs confirms to the relevant code of safety and standards mandatory for setting up wind projects. The standard includes Wind Turbine Safety and Design, Noise level and Mechanical Load. Therefore, the technology implemented can be depicted as environmentally safe and sound one.

BASELINE SCENARIO Thermal energy would be produced by more-GHG-intensive means based on the use of non-renewable sources PROJECT SCENERIO Project activity will harness wind as a source of energy production which is environmentally safe and sound technology. There is no GHG emission through project activity.

A.7. Debundling>>

This project is not a debundled component of a larger project activity.

SECTION B. Application of methodologies and standardized baselines

B.1. References to methodologies and standardized baselines >>

SECTORAL SCOPE – 01 Energy industries (Renewable/Non-renewable sources)

TYPE I - Renewable Energy Projects

CATEGORY- ACM0002 "Consolidated methodology for grid-connected electricity generation from renewable sources", Version 6

B.2. Applicability of methodologies and standardized baselines >>

The project activity is wind based renewable energy source, zero emission power project connected to the Rajasthan state grid, which forms part of the NEWNE grid. The project activity will displace fossil fuel-based electricity generation that would have otherwise been provided by the operation and expansion of the fossil fuel-based power plants in NEWNE grid.

The approved consolidated baseline and monitoring methodology ACM0002 Version 06 is the choice of the baseline and monitoring methodology and it is applicable because:

Para No.	Applicability Conditions as per ACM 0002	Applicability to this Project Activity
1.	The project activity is the installation capacity addition, retrofit or replacement of	The project activity is the installation of new grid connected renewable power
	a power plant/unit of one of the following types:	generation from wind.
	 Hydro power plant/unit (either with a run-of-river reservoir or an accumulation reservoir) Wind power plant/unit, 	
	 Geothermal power plant/unit, 	
	 Solar power plant/unit, 	
	Wave power plant/unitTidal power plant/unit.	
2.	In the case of capacity additions, retrofits or replacements: the existing plant started commercial operation prior to the start of a minimum historical reference period of five years, used for the calculation of baseline emissions and defined in the baseline emission section, and no capacity expansion or retrofit of the plant has been undertaken between the start of this minimum historical reference period and the implementation of the project activity;	This condition is not relevant, as the project activity does not involve capacity additions, retrofits or replacements.
3.	In case of hydro power plants:	This condition is not relevant, as the
	• The project activity is implemented in an existing reservoir, with no	project activity is not the installation of a hydro power plant.

change in the volume of reservoir. The project activity is implemented in an existing reservoir, where the volume of reservoir is increased and the power density of the project activity, as per definitions given in the Project Emissions section, is greater than 4 W/m². The project activity results in new reservoirs and the power density of the power plant, as per definitions given in the project emissions section, is greater than 4 W/m². 4. The methodology is not applicable to the The project activity does not involve any following: of the given criteria hence methodology is applicable for the project activity. activities Project that involve switching from fossil fuels to renewable energy sources at the site of the project activity, since in this case the baseline may be the continued use of fossil fuels at the site: • Biomass fired power plants; • Hydro power plants that result in new reservoirs or in the increase in existing reservoirs where the power density of the power plant is less than 4 W/m^2 . In the case of retrofits, replacements, or 5. The project activity is a new wind power capacity additions, this methodology is plant. No replacement, modification or only applicable if the most plausible retrofit measures are implemented here. baseline scenario, as a result of the Hence, this criterion is also not relevant identification of baseline scenario, is "the to the project activity. continuation of the current situation, i.e. to use the power generation equipment that already in use prior implementation of the project activity and business undertaking usual as

B.3. Applicability of double counting emission reductions >>

The project activity is registered under Clean Development Mechanism (CDM) project with registration number 1259, as well as Gold Standard (GS) with reference number 3664. The crediting period of this project under CDM & GS is 27/10/2008 to 26/10/2018. PP seeks verification under UCR from 27/10/2018 onwards, i.e., crediting period for UCR starts from 27/10/2018. Hence, there is no double counting for said projects.

B.4. Project boundary, sources and greenhouse gases (GHGs)>>

According to ACM0002, for the baseline emission factor, the spatial extent of the project boundary

maintenance".

includes the project site and all power plants connected physically to the electricity system that the CDM project power plant is connected to.

The Indian electricity system is divided into five regional grids, viz. Northern, Eastern, Western, Southern, and North-Eastern. Each grid covers several states. As the regional grids are interconnected, there is inter-state and inter-regional exchange. A small power exchange also takes place with neighbouring countries like Bhutan and Nepal.

The project boundary encompasses the physical extent of the northern regional electricity grid, which includes the project site and all power plants connected physically to the electricity system.

Power generation and supply within the regional grid is managed by Regional Load Dispatch Centre (RLDC). The Regional Power Committees (RPCs) provide a common platform for discussion and solution to the regional problems relating to the grid. Each state in a regional grid meets its demand with its own generation facilities and also with allocation from power plants owned by the Central Sector such as NTPC and NHPC etc. Specific quotas are allocated to each state from the Central Sector power plants. Depending on the demand and generation, there are electricity exports and imports between states in the regional grid. The regional grid thus represents the largest electricity grid where power plants can be dispatched without significant constraints and thus, represents the "project electricity system" for the Project. As the Project is connected to the Northern regional electricity grid, the Northern grid is the "project electricity system".

	Source	Gas	Included?	Justification/ Explanation
	Electricity generation	CO_2	Included	Main emission source
a)	from power plants connected to the Northern Grid	CH ₄	Excluded	This source is not required to be estimated for wind energy projects under ACM0002
Baseline		N ₂ O	Excluded	This source is not required to be estimated for wind energy projects under ACM0002
t خ	Electricity generation	CO ₂	Excluded	Wind energy generation does not
jec ivit	from the Project	CH_4	Excluded	have any direct GHG emissions.
Project Activity		N ₂ O	Excluded	

B.5. Establishment and description of baseline scenario (UCR Standard or Methodology) >>

According to ACM0002, for project activities that do not modify or retrofit an existing electricity generation facility, the baseline scenario is the following:

Electricity delivered to the grid by the project would have otherwise been generated by the operation of grid-connected power plants and by the addition of new generation sources, as reflected in the combined margin (CM) calculations described below.

As the Project does not modify or retrofit an existing generation facility, the baseline scenario is the emissions generated by the operation of grid-connected power plants and by the addition of new generation sources. This is estimated using calculation of Combined Margin multiplied by electricity delivered to the grid by the Project.

According to the approved baseline methodology ACM0002, the emission reductions ERy by the

project activity during a given year "y1" is

$$ERy = BEy - PEy - Ly....(1)$$

where BEy is the baseline emissions

PEy is project activity emissions and;

Ly is the amount of emissions leakage resulting from the project activity.

Baseline Emissions for the amount of electricity supplied by project activity, BEy is calculated as

$$BEy = EGy * EFy \dots (2)$$

where EGy is the electricity supplied to the grid, EFy is the CO_2 emission factor of the grid, 0.9 as per UCR Standard

Project Emissions:

The project activity uses wind power to generate electricity and hence the emissions from the project activity are taken as nil.

$$PEy = 0$$

Leakage:

Emissions Leakage on account of the project activity is ignored in accordance with ACM0002.

$$Ly = 0$$

Annual electricity supplied to the grid by the Project

- = 68.8 MW (Capacity) x 22% (PLF) x 8760 (hours)
- = 132591.36 MWh

Annual baseline emissions

- = 0.9 tCO2e/MWh x 115632 GWh
- = 119,332 tCO2e

Estimated Annual or Total baseline emission reductions (BEy) = 119,332 CoUs /year (119,332 tCO2eq/yr)

B.6. Prior History>>

The project activity is registered as CDM project with reference number 1259 and as GS project with reference number 3664 for generation or issuance of carbon credits with fixed crediting period from 27/10/2008 to 26/10/2018.

¹ Throughout the document, the suffix y denotes that such parameter is a function of the year y, thus to be monitored at least annually.

B.7. Changes to start date of crediting period >>

The crediting period under UCR will start from 27/10/2018 onwards.

B.8. Permanent changes from PCN monitoring plan, applied methodology or applied standardized baseline >>

There are no permanent changes from registered PCN monitoring plan and applied methodology.

B.9. Monitoring period number and duration>>

First Issuance Period: 3 years, 4 months – 27/10/2018 to 31/01/2022

B.8. Monitoring plan>>

Data/Parameter	$\mathbf{EG_y}$
Data unit	MWh (Mega-Watt hour)
Description	Net electricity supplied to the grid by the Project
Source of data Value(s) applied	Electricity supplied to the grid as per two joint meter readings (Form B) taken at 33 kV metering point.
Measurement methods and procedures	The values of net electricity supplied to the grid mentioned in the two joint meter readings (Form B) of the project for 56.8 MW and 12 MW at 33kV metering point can be cross checked with values mentioned in the invoice raised on the state utility. All main & check meters connected at metering points with RR. No. KBCWP 01 (220kV metering point), KBCWP 02 (33kVmetering point) & KBCWP03 (33kV metering point) are tested for accuracy on annual basis by state utility and in case of error beyond permissible limit; meters are calibrated by either of KPTCL or BESCOM.
Monitoring frequency	Monthly
Purpose of data	Baseline Emissions calculations

Data / Parameter:	EGexport
Data unit:	MWh (Mega-Watt hour)
Description:	Summation of electricity Export recorded at meters (two main and two check) connecting 86 machines of
	the project activity and can be sourced from two joint meter readings (Form B) issued by BESCOM for 56.8 MW and 12 MW at 33 kV metering point
Source of data:	Electricity export to the grid as per two joint meter readings (Form B) taken at 33 kV metering point.
Measurement procedures (if any):	The values of net electricity supplied to the grid mentioned in the two joint meter readings (Form B) of the project for 56.8 MW and 12 MW at 33kV metering point can be cross checked with values mentioned in the invoice raised on the state utility. All main & check meters connected at metering points

	with RR. No. KBCWP 01 (220kV metering point), KBCWP 02 (33kVmetering point) & KBCWP03 (33kV metering point) are tested for accuracy on annual basis by state utility and in case of error beyond permissible limit; meters are calibrated by either of KPTCL or BESCOM.
Monitoring frequency:	Monthly
QA/QC procedures:	The value is calculated and can be cross checked
	from the invoices raised on the state utility.
Any comment:	Not Applicable

Data / Parameter:	EGimport
Data unit:	MWh (Mega-Watt hour)
Description:	Summation of electricity Import recorded at the
	meters (two main and two check) connecting 86
	machines of the project activity and can be sourced
	from two joint meter readings (Form B) issued by
	BESCOM for 56.8 MW and 12 MW at 33 kV
	metering point.
Source of data:	Electricity export to the grid as per two joint meter
	readings (Form B) taken at 33 kV metering point.
Measurement	The values of net electricity supplied to the grid
procedures (if any):	mentioned in the two joint meter readings (Form B)
	of the project for 56.8 MW and 12 MW at 33kV
	metering point can be cross checked with values
	mentioned in the invoice raised on the state utility. All
	main & check meters connected at metering points
	with RR. No. KBCWP 01 (220kV metering point),
